Detect Low Stock

+

...

≡

▼ Description

As a Pharmacy Clerk,
I want the system to detect when medicine stock falls below its safety threshold,
so that replenishment can be triggered before a shortage occurs.

Acceptance Criteria:

1. The system shall continuously monitor medicine stock levels.
2. The system shall compare stock levels against the configured safety threshold.
3. When stock falls below the threshold, the system shall flag the item.
4. The system shall identify the medicine requiring replenishment.
5. The low-stock condition shall be available for purchase-order processing.

Sprint

SEL Sprint 1

Priority

Screenshot 2 — SEL-7 Detect Low Stock opened in Jira

Story point assignments. (Screenshot 2)

The sprint contains the five stories used in the simulation. Each story is estimated at 1 story point, for a total of 5 story points.

Issue	User Story	Story Points
SEL-7	Detect Low Stock	1
SEL-2	Track Batch Expiry	1
SEL-4	Dispense Medicine Using FEFO	1
SEL-3	Generate FEFO Dispensing List	1
SEL-6	Configure Medicine Stock Threshold	1
	Total	5

Burndown Chart. (Screenshot 4)

Sprint 1

Screenshot 14 — Sprint 1 Burndown Chart

Reflection Questions:

1. Did your estimations reflect the actual effort?

The one-point estimates provided a consistent basis for measuring progress because all five stories were given the same relative estimate. For this sprint simulation, the estimates were sufficient for tracking completion and the burndown. However, the burndown also shows that the stories were not completed at a uniform rate, so in a real project I would use past velocity and team experience to refine future estimates.

2. Was your backlog well-prioritized?

Yes, the backlog was appropriately prioritized for the scope of this sprint. The selected stories covered core pharmacy inventory functions such as low-stock detection, batch-expiry tracking, FEFO dispensing, FEFO list generation, and stock-threshold configuration. This gave the sprint a coherent focus around medicine inventory and expiry management.

3. How did your simulated sprint align with your plan?

The simulated sprint followed the planned workflow from backlog selection to Active Sprint execution and completion. The five selected stories were moved through the workflow and completed, while the burndown tracked the reduction from 5 remaining items to 0. This showed how the planned backlog translated into measurable sprint progress.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed that the team completed all 5 planned work items within the sprint. The stepwise decreases from 5 to 0 show that work was completed at different points rather than at a constant rate. This gives a practical view of remaining workload and helps a team judge whether its current pace and capacity are sufficient to finish the committed sprint scope.
